

What if you don't know what you want to eat?

Zomato's "Think it, Search it" is an interesting answer.

The user isn't always searching for a dish.

Sometimes they're searching for a **mood**, an **occasion** or an **intent**.

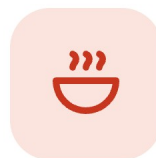

Netflix night

Date night

Something spicy

Comfort food

Two very different journeys.

TRADITIONAL SEARCH

Know what you want

Search

Find

INTENT-BASED DISCOVERY

Know the situation

Explore

Discover

Decide

The starting point moves from **a keyword** to **a situation**.

“

Help me decide what to eat when I don't know exactly what I want.

That's a very different problem from:

“Help me find the restaurant I'm already looking for.”

What I'd measure

01 **Search → Order conversion**
Do searches end in an order?

02 **Decision time**
How long from “I’m hungry” to checkout?

03 **Search abandonment**
How often users give up without choosing

04 **Discovery → Order conversion**
Do intent-led suggestions turn into orders?

05 **Repeat usage**
Do users come back to search by mood?

**Great search doesn't
always help users search
better.**

**Sometimes, it helps users figure
out what to search for.**

Would you call this **Search**, **Discovery**, or **Decision Support**?
